

Importance of page layout for website development in India.

An organized layout can significantly improve usability. Typography is really important for website development India, especially when majority of the content is text. Good typography sets out the layout by setting overall pattern and contrast. A well-structured document will help the reader to foresee where information is located. For example headers followed by sub-headings indicate to the reader that the most important information is located at the top of the page.

Through the years our mental growth has been based on building new administrative systems for already established abilities. The actual acquisition of new skills plays a secondary role. The brain still looks for the visual cues on the web as in print.

The web is fast medium and the one thing that differs on website development in India as compared to print is the level of attention. The computer screens low resolution makes reading the pages very exhausting. A web pages layout is usually in contrast to the fundamental rule of book and magazine typography. Most pages will have lines of text that are too long for easy reading. At normal reading distances the eye's span of acute focus is only about three inches wide, so most publishers usually text in dense passages of similar length. If the lines of text are wider then the reader will have to move his head slightly and it will cause more strain on the eye muscles. Readers might lose track of what they are reading because of "the long trip back to the left margin". Therefore large blocks of text should be avoided and it would be more effective for website development India if the text is broken into shorter sentences and possibly placed on separate pages.

To communicate the information in an accurate, quick and efficient manner web pages should have to the point prose and bullet points. What seems dull on paper is suitable for electronic format, to reach the best balance between space efficiency and legibility.
